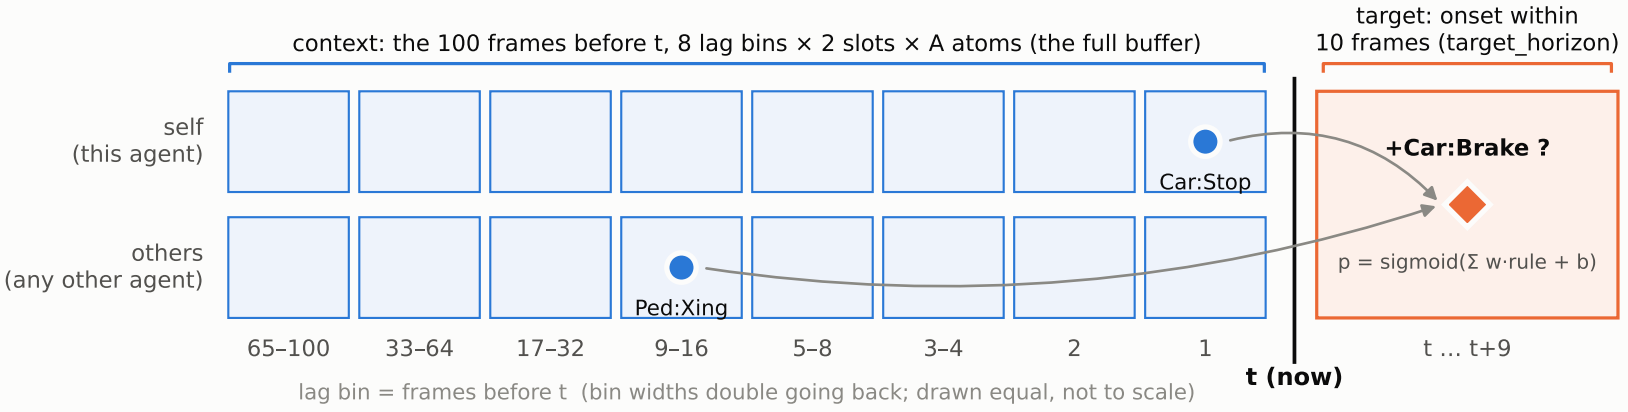
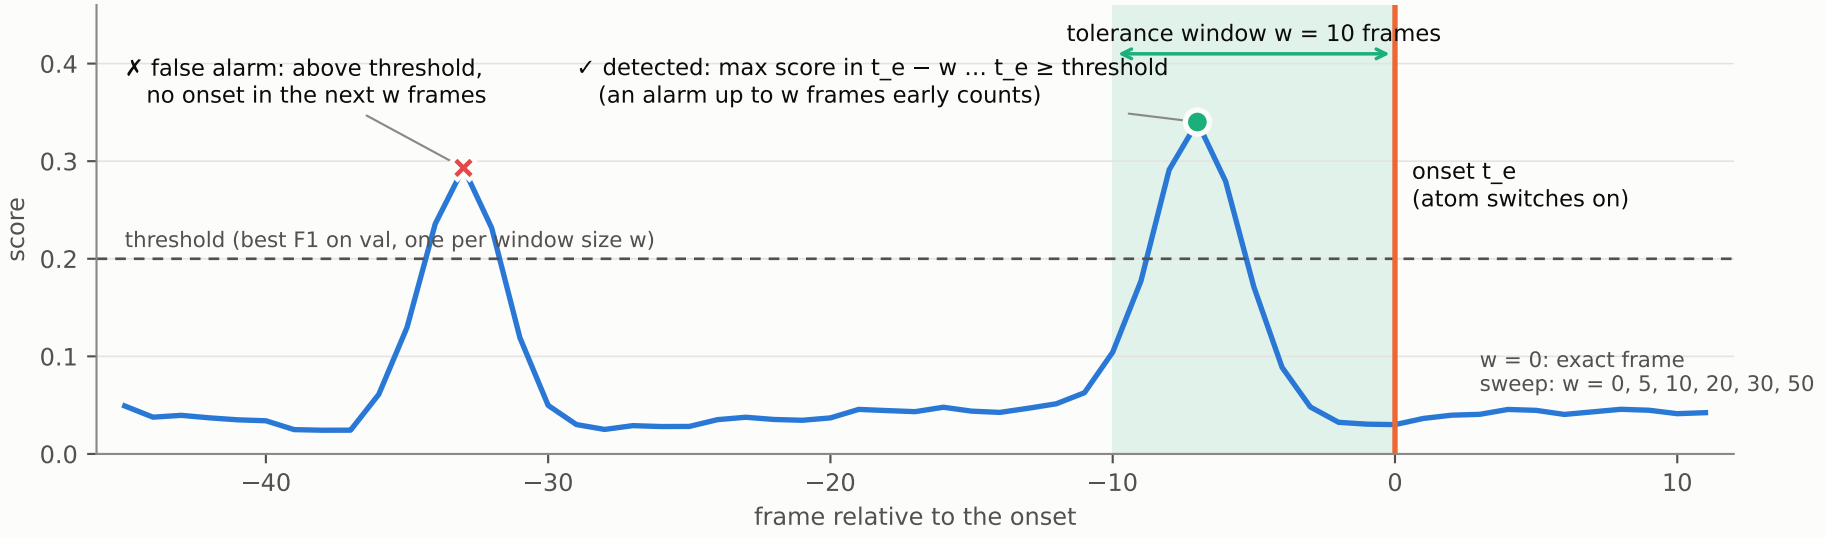
CauVid pipeline — the delay idea: learned lags (step 05) and early-alarm tolerance (step 06)

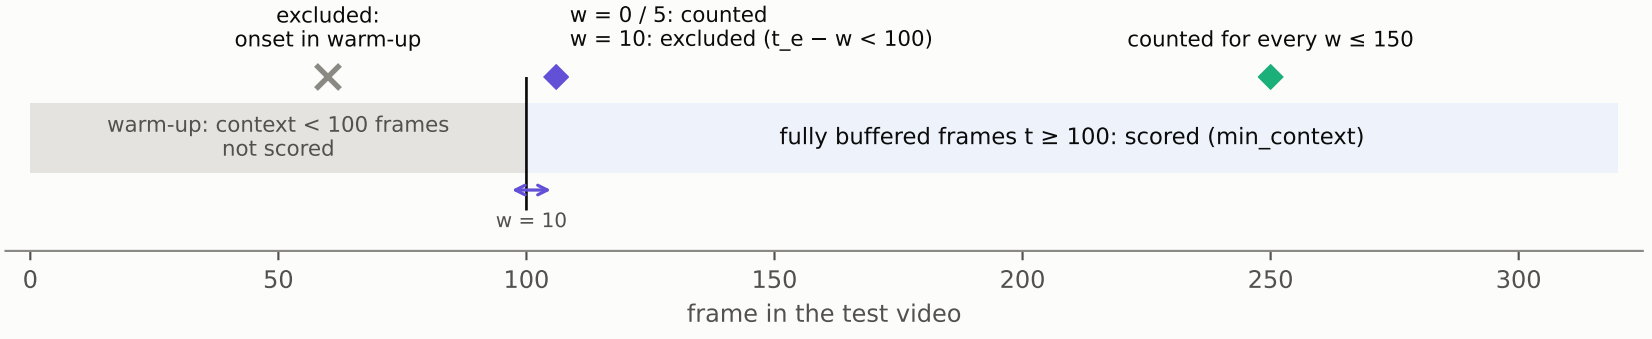
A Step 05: one prediction at frame t — delays live in the lag bins of the rule body



rule (soft AND): Ped:Xing(other)@9–16 → Car:Stop(self)@1 ⇒ +Car:Brake within 10 frames
the lag bins of the body atoms are the learned delays from cause to effect

B Step 06: event detection — how far ahead an alarm may come





C Step 06: only fully buffered predictions, and only events whose whole window is buffered
