

Step 6 - Forward Prediction and Consistency Verification

Output: per-hypothesis residual packets and localized conflicts

Forward-project each physical world state, then test its predicted video signatures against independent evidence

Π frozen fit/check evidence roles · $\mathcal{V}_i$ predicted video context · r_* residual family · $\mathcal{R}_i$ auditable residual packet

Every residual is tied to a hypothesis, constraint, time window, uncertainty model and evidence reference.

Step 7 packages the most informative conflict windows for diagnosis.
